

Installing Richard Burns Rally in 2021

Times are changing and currently the go-to option for new RBR users should be the Rallysimfans (also known as RSF/HU/Hungarian) plugin. Other plugins such as Czech plugin and RSRBR still have a major user base but are becoming undeniably outdated and out of further active development. The developers of RSF have been doing an amazing job with the plugin to make RBR more user-friendly than what it has ever been in the 16 years of its existence.

Rallysimfans installer includes the original base game with two official patches and every essential plugin to get you started.

- NGPcarmenu by Mika-n: various UI improvements and customization options
- Fixup and NGP by Workerbee: Up-to-date physics and general game features
- Pacenote Plugin by Workerbee: allows you to edit pacenotes and camera settings
- RBR_RX by JHarro: enables the usage of tracks created with BTB (Bob's Track Builder)
- Gauger plugin by V317MT: ingame dashboard/telemetry thing
- RBRVR v1.6 by Keijo "Kegetys" Ruotsalainen: the plugin for VR users

Very short TL;DR for the people who can't be bothered to read this whole document properly or believe they can do without, here is what you need to do:

1. Download installer at <http://www.rallysimfans.hu/rbr/download.php?download=rsfrbr>
2. Make a driver account at the website
3. Run the installer and choose what you want for
 - a. Base game (essential, never leave this unchecked when installing first time)
 - b. Plugins (all are recommended **except** RBRVR plugin if you're not a VR user)
 - c. Stages (choose less if you don't have enough disk space)
 - d. Additional options
4. Run the game from RichardBurnsRally_SSE.exe.
5. Drive in the rallysimfans.hu plugin (Online rally, Hotlap rank, Practice)

How to install

First of all, you will not need an existing base game. If you have an existing RBR install don't even think about trying to install RSF plugin into the same folder.

Go to <http://www.rallysimfans.hu/rbr/index.php> and find the newest installer .exe on the front page. As of November 2021, the newest version is Rallysimfans_Installer_v1.16.1. First thing the installer will ask is where to install. **Do not install into the following locations:**

C:\Program Files\
C:\Program Files (x86)\
C:\Users\Your name\
C:\Program\
Desktop

NOTE: many antivirus programs are falsely detecting and quarantining some of the files during the download. Make sure your antivirus programs are disabled before continuing further. A good tip is also to add the whole RBR folder into your Windows Defender exceptions. This will also make the game boot much faster as it's not scanning the files every time.

- Create a folder called "Richard Burns Rally HU" or similar.
 - Don't use special characters of any kind (for example RBR Húngaro)
- Select full installation

The download size is about 15 GB. When extracted, the game takes about 90-100 GB of space. Make sure you have enough space on the drive you're installing to. Most of the size comes from the ~400 or so modded stages so if you just want to try the game first without all content, feel free to leave most of the Maps out of the install. The vanilla game tracks are still some of the best, and good enough for the average once-a-week player. They are included with the base game so even if you decide to leave all Maps out from the install, you will still have about 40 stages to drive on.

NOTE: if you plan to drive online rallies, the only easy way is to install all tracks at once!

Installation	Size download (extracted)	Total price
Minimal install (base game)	<2 GB (4 GB)	0 €/\$/£
Only original stages and modded cars+physics+sounds	<3GB (10 GB)	0 €/\$/£
Everything (recommended)	13-14 GB (90-100 GB)	0 €/\$/£

The original Robert Reid codriver sound is selected by default. Choose this if you don't want a Hungarian speaking codriver. **You can download and install other codriver mods externally.**

Audio update and FMOD Audio banks are recommended to install. Gauger Plugin shows live telemetry data on the screen, choose this if you want it. Select RBRvr mod if you want to drive in VR.

On the next “additional tasks” page, it is recommended to check every single checkbox **except** the Adaptive Force Feedback (known to cause FPS issues). Make sure to scroll down to check the DirectX 9c installation is selected too.

Click next and it will take you to a summary page. If you’re happy with the settings, click install. Now, the installer is known to occasionally freeze for an undetermined amount of time depending on the server load. If it does, keep calm and wait. It will continue automatically when the queue clears up.

If you’ve done everything correctly, you should now have a working RBR Rallysimfans install. **Now you are ready to run the game from RichardBurnsRally_SSE.exe or the desktop shortcut that was created.**

NOTE: If your game doesn’t start even after that, you will need to

- 1) Run it as an administrator
- 2) Add it to DEP exceptions

Quote from Vauhtimurot blog: “Type sysdm.cpl (.cpl refers to Control Panel) in the Windows search box and run it → On the Advanced tab go to Performance settings → Data Execution Prevention tab (check Turn on DEP for all programs and services except those I select and add RichardBurnsRally_SSE.exe to the list.”

This step will solve about 99% of launching problems. If it doesn’t, there is something major wrong with the installation (see FAQ).

Inside RBR

When you start RBR for the first time, it should skip some of the original menus to the rallysimfans plugin straight away. If it doesn’t and you see the original main menu, navigate to Options -> Plugins -> rallysimfans.hu to play the game. The traditional Quick Rally, Rally School and Rally Season game modes are NOT playable without little tweaks we’re not gonna explain in this tutorial.

Now, there are three game modes in RSF: **Online Rally**, **Time Trial (Hotlap rank)** and **Practice**.

They are pretty much self explanatory, so we’ll not go deeper with this topic.

One of the main features in RSF that is superior to any RBR mod in the past is the car management. In RSF, all cars (as of right now there are 91 NGP6 physics cars) are always available without restarting the game. The traditional RBR 8 “car slots” can be forgotten forever. One feature not many people realise at first is that on the stage and car selections, you can press enter to get to the bigger selection screen, instead of scrolling through them one by one.

Cars, physics, sounds and setups are downloaded from the server automatically when you enter a stage for the first time with the car. One thing that might annoy some people is the low

quality of default car liveries. This is an intentional feature to speed up the car download. You are free to download better liveries from the internet or make your own.

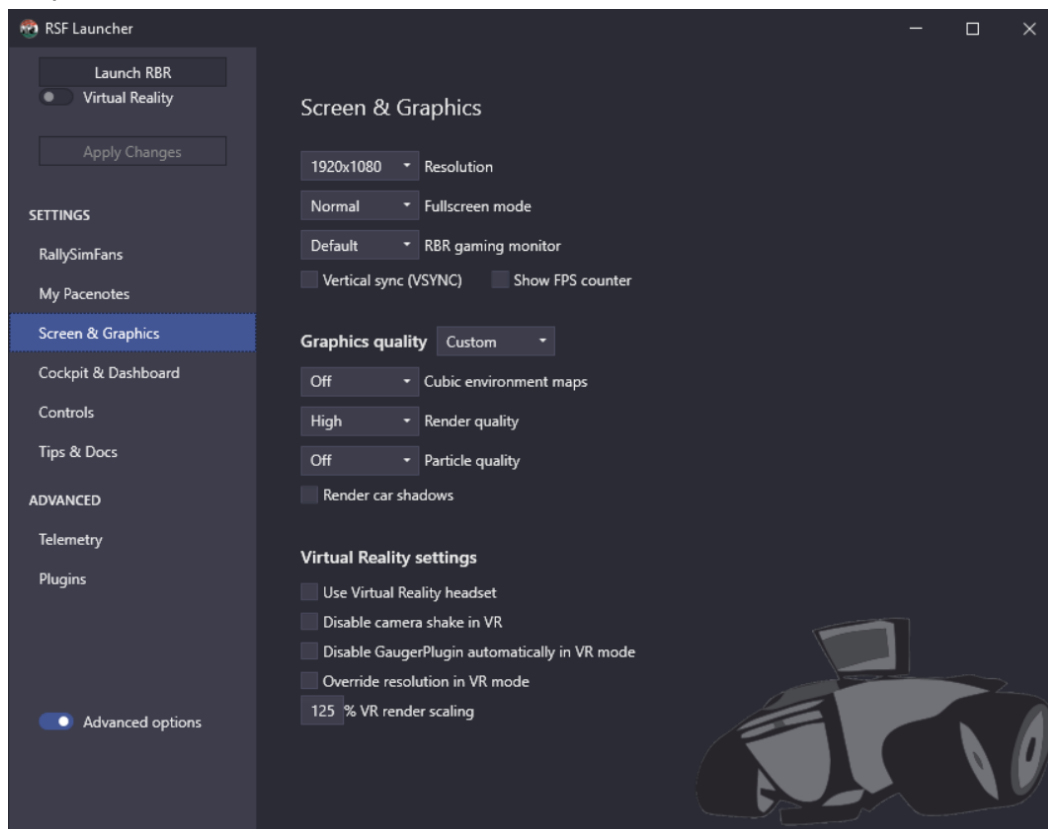

NOTE: Extremely useful tip for users with an existing CZ installation, you can copy and paste the whole Cars folder to HU installation. This way you don't have to set camera angles and skins again.

You do not need RBRCIT or any other external car installation tools with RSF.

Control bindings should be done from the main menu/options/controls page. Navigate to the main menu by pressing ESC when you are in Rallysimfans.hu plugin. If you do them when on stage, they might not be saved properly. If you see the control axis of throttle/brake/clutch/handbrake is inverted, switch the axis direction in the **RSF Launcher** (read next topic) . Once you are happy with the control bindings, back out to the main menu and the game will ask you to save the profile.

Most common settings options

RSF Launcher by Mika-n is the recommended tool to tweak settings for the game. Run it from: main folder/rsf_launcher/RSF_Launcher.exe or the desktop shortcut was created when you installed the game. The RSF Launcher has almost every setting you might want to change in easy checkbox or dropdown list format.

How to register to race online

- Go to the website of the plugin (<https://rallysimfans.hu/rbr/index.php>) and click register. You will be guided to the forum. It's Hungarian by default but you can change it to English in the top right corner.
- Agree the terms and conditions.
- Fill in the required things (your username, an email address and your password) and submit.
- You will receive an email where you can activate your account.

Once this is complete, you can now open the game and go to either "online rally" or "hotlap" where it will ask you for a username and a password. These are the same ones you filled in while registering. Enter those and you are good to go.

If you want to log in automatically, go to Rallysimfans.hu > Options > Tick the box that says "Auto login".

How to update your installation

One of the greatest features of RSF is that all updates regarding cars, physics and sounds are automatic. For these, you don't have to do anything. For larger plugin updates such as when new features or new stages are released, a new installer will be published. Run that like you did when you installed the game and choose "update installation" on the first page. It should automatically have the checkbox marked on all new content, but you should take a look yourself.

To be more clear, RSF may have two kinds of updates and this is how those are updated:

(1) Rallysimfans or other "must-have" plugin updates. There is no need to run installer to update these. All it takes is to start RBR as usual and RSF will automatically update required plugins if necessary (top left corner shows a small downloading window). Also, new FMOD audio files or cars are also automatically updated by RSF plugin, so no need to manually download those via installer.

(2) New maps. This one requires to run the RSF installer app because RSF plugin doesn't download maps automatically. If there is no new RSF installer version then simply re-run the one you already have (or if in doubt then check the web site and download the latest rsf installer).

FAQ - Frequently asked questions and answers

If you experience weird problems with the game, first of all make sure you didn't install it in these folders:

- C: \ Program Files \
- C: \ Program Files (x86) \
- C: \ Users \ Your Account Name \
- C: \ Program
- Desktop

Q: My game doesn't start

A: First, run the installer in "Custom Installation" mode. If that doesn't work, DEP settings will.

Quote from Vauhtimurot troubleshooting:

<https://vauhtimurot.blogspot.com/p/troubleshooting.html#GameDoesntLaunch>

"The DEP settings: Type sysdm.cpl (.cpl refers to Control Panel) in the Windows search box and run it → On the Advanced tab go to Performance settings → Data Execution Prevention tab (check Turn on DEP for all programs and services except those I select and add RichardBurnsRally_SSE.exe to the list.)"

One very rare case of game not starting might be due to the Gauger Plugin, so if nothing else has fixed it try to disable the Gauger Plugin from the RSF Launcher.

Q: How do I set up wheel and pedals?

A: <https://vauhtimurot.blogspot.com/p/setting-up-your-wheel.html>

Q: My controls don't save

A: Change them in the main options menu (back out from RSF plugin) and back out to the main menu. It will ask you to save the options. If you change them while in stage they might not save properly. If they are still not saved, delete the pfPROFILENAME.acm file from your SavedGames folder. Set controls in-game once more and make that file read-only.

Q: I accidentally installed Hungarian codriver, how do I change it?

A: Run the most recent installer and leave the checkmark only on Pacenote plugin (Workerbee) and Original English codriver. You can install whatever codriver you find on the internet, but the original is enough for most beginners.

Q: How to change FOV and other camera settings?

A: Double click right on stage and a window will pop up. More here:

<https://vauhtimurot.blogspot.com/p/editing-cameras.html>

TIP! You can set up a common FOV for all cars in RSF Launcher "Cockpit & Dashboard" page.

Q: How to hide the steering wheel / windscreen / wipers?

A: RSF Launcher has an option for these on the "Cockpit & Dashboard" page.

Q: My pedals / handbrake are inverted

A: Change the inverted axis in the RSF Launcher “Controls” page.

Q: How do I disable the gauger plugin?

A:

The default gauger takes up a lot of screen space and it is quite annoying.

Go to main menu > options > plugins > gauger plugin and select disable

It is also possible to mod the configuration file however you want it to look like. RSF Launcher has many options for different Gauger layouts.

Q: I can't see any modded cars/stages

A: You should always drive in the rallysimfans.hu plugin. You can navigate there from the main menu by going options -> plugins -> rallysimfans.hu. Quick rally and Rally School game modes don't work properly without tweaking some other things.

Q: How do I get the new content?

A: Cars, sounds and physics are updated automatically. There will be a notification in the Discord server whenever something new gets released. For new stages, download a new installer and choose only the new content you want to download.

Q: How to change ingame wheel animation rotation?

A: RSF Launcher has an option for this in the “Cockpit & Dashboard” page.

Q: How do I install new liveries for the cars?

A: Download the livery and overwrite the files in RBR/Cars/YOUR CAR/textures/ folder. Find skins for example here: <http://rbrplus.blogspot.com/>

Q: The game resolution is not right/it looks like the menus are “zoomed in”

A:

- Make sure the XRes and YRes are correct in the richardburnsrally.ini file
 - Make sure your Windows scaling is set at 100%
- OR
- Right click on RichardBurnsRally_sse.exe -> properties tab -> compatibility tab -> click “Modify high DPI scaling options”
 - Set “Override high DPI scaling behavior” option and choose “Application” instead of System scaling value

Q: RallySchool doesn't work. The game crashes or a car is stuck at neutral and 1st gear in RallySchool, QuickRally or in RBR_RX

A: The original RBR cars don't work with the newer NGP6 physics made by WorkerBee. RallySimFans plugin (=RSF) uses NGP6 physics. If you really really really want to use RallySchool, QuickRally or RBR_RX menus then you need to

- (0) in rallysimfans options the “Restore cars” option needs to be unchecked

- (1) download RBRCIT tool from github.com/zissakos/RBRCIT/releases,
- (2) unpack the RBRCIT_v1.2.0.zip file on the root folder of RBR installation,
- (3) run RBRCIT.EXE app,
- (4) Choose "Download / Update carlist.ini" menu command,
- (5) Use the tool to install NGP6 cars into slots 0-7 shown in InstalledCars list on the top right corner in RBRCIT tool. Choose any of the custom cars from the list on the left (press download link in model, physics and FMOD cells if this is the first time you use the tool).
- (6) If you want to use RallySchool in RBR then tick a checkbox in "Replace School Car files (slot 5)" option. If you want to use QuickRally or RBR_RX plugin then this option is not necessary. Also you may need to disable the "Rally School menu replacement" option in NGPcarmenu settings. (Main menu > options > plugins > NGPcarmenu)
- (7) Finally press "Apply" button on the bottom right corner and then you are ready to drive with a NGP6 compatible car in RallySchool/QuickRally/RBR_RX. Notice! One more thing. Go to RallySchool/QuickRally/rbr_rx right after booting up RBR. Once you drive a stage via RSF plugin then these legacy menus are broken until you restart RBR.

Q: QuickRally menu doesn't work (game crashes) or cannot see all cars and stages.

A: Forget the legacy QuickRally offline rallying RBR menu (it has only 8 cars and about 30 stages). Go to Options/Plugins/Rallysimfans.hu and use the Practice menu to drive stages in offline mode. RSF plugin allows you to use all 85+ cars and 400+ stages (created by talented people in RBR community).

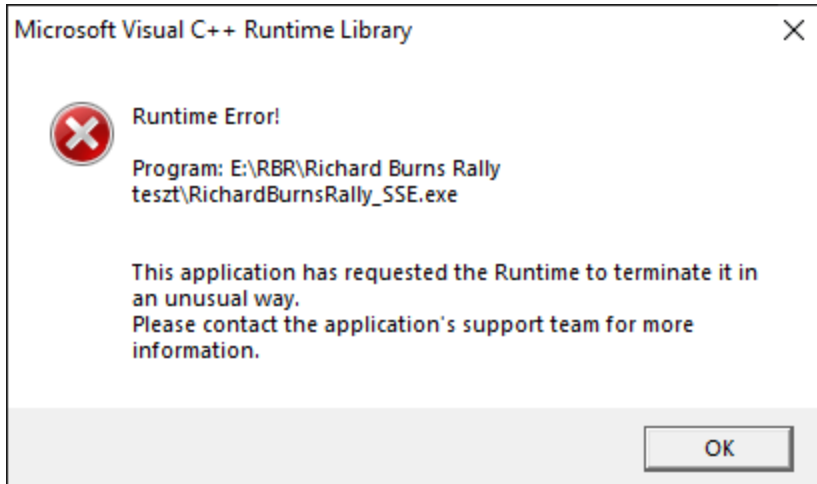

Common error messages.

1):

A: You have the VR plugin installed but no VR headset is found. If you're trying to play without VR, apply VR mode on and then off in the RSF Launcher.

2):

A: Missing or faulty stage files. Reinstall the stage. Could also be related to car physics.
